

- 1) Write a function `greet_user` which takes 2 parameters `first_name`, `last_name` and prints a personalized message like : “Hello, Bob Ross! Welcome back!”
If the last name is not given it should print the same message without the lastname
- 2) Write a function `find_max(a,b,c)` that returns the largest of 3 numbers without using Python’s built – in `max()`
- 3) Write a function `average(numbers)` that takes a list of numbers and returns their average.
If the list is empty, return 0
- 4) Write a function `filter_even(numbers)` that takes a list of integers and returns a new list containing only the even numbers.
- 5) Write a recursive function `factorial(n)` that returns the factorial of n. If $n < 0$ then return “Invalid Input”
- 6) Write a function `write_lines(filename, lines)` that takes a filename and a list of strings and writes each string on a new line
- 7) Write a function `count_words(filename)` that reads a text file and prints the number of words in it
- 8) Write a function `longest_length(filename)` that reads a file and prints the line with the maximum length
- 9) Write a function `reverse_file(input_file, output_file)` that reads all lines from `input_file` and writes them in reverse order to `output_file`.
- 10) Write a function `word_frequency(filename)` that reads a text file and prints how many times each word appears (case insensitive -> the and THE are the same word)
